
Embarcadero Rad Studio Xe3 Update 1 Crack tamaber

You can now take advantage of the new 64-bit compiler support to create C++ applications for Windows 64-bit. For a small price of US\$149 you can get a license key for a full C++Builder version 10 and get access to the 64-bit compiler. The old 32-bit compiler will still be available, but it is deprecated and we will be phasing it out eventually. If you want to update your apps to be 64-bit compatible, this is a great time to do so. There are also some minor bugfixes in this update. New New features include: 1. Added support for 64-bit compilers for Windows. This includes the C++Builder 64-bit compiler, which is included with all current C++Builder versions 10 through 14. The old 32-bit compiler will still be available, but it is deprecated and we will be phasing it out eventually. 2. Improved 64-bit support for new Delphi XE3 features. This includes improved error messages, improved 64-bit compiler tooltips and a few other features. 3. Added the option to create and debug 64-bit debug symbols for all debug levels. 4. Improved performance for older Windows systems. Thanks to the improvements of the 64-bit compiler we can create 64-bit debug symbols that are as large as the 32-bit ones (and even larger). This makes debugging applications on a wide range of systems easier. Fixes: 1. Fix for Forms and Controls with 64-bit components that contain bitmaps that may not have the expected quality. 2. Fix for a problem that would cause incorrect compilation if a class did not have a default constructor. 3. Corrected a problem with code organization of the native Windows run-time library in C++ Builder. It's an exciting time to update your C++Builder and RAD Studio products. We hope that these new features and fixes will make your C++ development easier.#!/bin/bash set -e script_dir=\$(dirname \$0) dir=\$(script_dir/.." if [-n "\${XDG_CONFIG_HOME}"]; then . \${XDG_CONFIG_HOME}/config
