The course will cover the basic understanding of these protocols and MAC sublayers. It will also describe the network, channel, data link, and physical layers, as well as the RF networks and mediums that they are used in. Lastly, the course will explain the different approaches that can be used to perform traffic engineering and how they are implemented. By the end of this course, students will be able to describe the different types of network protocols and MAC sublayers that are used in wireless and analyze basic network routing protocols, such as OSPF and how it is used. Students will also be able to describe data link layer features and how the different protocols work in an Ethernet environment. Finally, they will be able to describe the different ways of performing traffic engineering.
