WSM3523. The aromatic catabolic operon (aacA1-paql-bphC-bphE-gntR-bphS) of Burkholderia sp. WSM3523 catalyzes the oxidative degradation of phenol to hydroquinone via ortho-cleavage and the release of NH(3). Previously, it has been suggested that the substrate for ortho-cleavage is phenol quinone rather than phenol. To investigate the mechanism, a set of mutants deficient in the ortho-cleavage activity of the naphthalene dioxygenase or the catechol 1,2-dioxygenase was constructed and characterized. The results indicate that the major catabolite of the aromatic catabolic operon is 3-hydroxy-2-oxoadipate, which is produced from catechol 1
