Field of the Invention The invention relates to a cable/communication harness designed to be a temporary harness before a permanent harness is installed. 2. Background of the Invention In the field of vehicle technology, in-vehicle networking and other such applications are being developed which involve connecting two or more electronic components to one another in order to form one larger system or device. FIG. 14 illustrates an example of the aforementioned in-vehicle networking. As shown in FIG. 14, an automobile 200 has a communication system 300 in its central compartment, and a drive control circuit 300 is connected to an in-vehicle radio unit 301 through communication cables 302 and 303. The drive control circuit is connected to a vehicle ignition system 401 through a harness (route 1003), and the vehicle ignition system is connected to a starting device 402. Various electronic components and internal devices are connected to a vehicle engine 405. Accordingly, a circuit which controls the vehicle is integrated into the automobile 200. The aforementioned in-vehicle networking is also called a distributed control system (DCS). In such a DCS, various electronic components in the vehicle are connected to one another through a network such as a CAN (Controller Area Network), and this network is used to monitor information, process information and control functions. Since electronic components in the vehicle are connected to one another through a network, the number of harnesses connected to the electronic components in the vehicle will increase. For example, the number of harnesses increases with each ignition switch system, brake switch system, display/control switch system and in-vehicle audio system and the like. When connecting components to one another through a number of harnesses, since the harness is connected to the components at only one end of each harness, the harness is easily subject to damage and there is an increased risk of malfunction. One example of a conventional structure is shown in Japanese Patent Application Laid-Open No. H08-202360 (FIG. 3). As shown in FIG. 3, a first harness (route 1) is connected to a connector on an electronic component A, and a second harness (route 2) is connected to a connector on an electronic component B. Another example of a conventional structure is shown e24f408de9
