Famulus Crack + Free [Mac/Win] [2022-Latest]

There are many times when you need to run programs at the same time. In fact, there are many places that you need to run multiple applications at the same time. Perhaps one needs to be able to access the same remote FTP site with both a Web browser and a file transfer client. Perhaps you need to be able to simultaneously run two instances of MPlayer for different inputs.

There are a number of options available to accomplish this task. On Windows you have the FileRun application or the Start menu context menu. Other operating systems have similar functionality. These options are quite handy, but they have drawbacks. For example, on Windows you can only run one application at a time, and many applications don't use the tray icon.

Famulus makes it possible to run multiple applications at once. It emulates the Windows Start menu by employing a special key combination that starts a list of applications and the commands they can be run. Famulus is lightweight and fast, allowing for a considerable number of applications to be launched at once, even with a small desktop size. Famulus Features: Simple to use. Just hold the \* key for a moment, and you can run multiple applications at the same time. Lightweight and fast. Famulus is small and does not consume much system resources. Minimal interface. Famulus has only one control, the \* key. To start a program simply hold down the \* key for a moment. An intelligent auto-start. Famulus works even if the computer is in sleep mode. Can be customized. Famulus has no default applications, and allows for easy customizations. Startup programs can be automatically started at log in. Clipboard support. Famulus supports use of the Clipboard. Famulus is a simple and easy to use program that allows you to easily launch different applications. Most file launchers employ a graphical interface, but a few, like Famulus and the Windows Run application, use typed commands. Famulus works by holding down a designated key (default is the numpad \* key) for a fraction of a second, which will cause a prompt to be displayed. In this prompt you can type predefined commands associated with files or folders on your computer, or by prepending the @ symbol you can type web addresses, file paths or system commands and have them run directly. Famulus Pros: Famulus is designed to work perfectly well with a variety of applications; Famulus is perfect for beginners, but advanced users will find its command line usage easier to learn than the Windows Run application; Famulus is very lightweight and has a clean and simple interface; It allows you to be more efficient in launching applications; Famulus Cons: If you are looking for a classic Windows file launcher that is extremely simple to use, Famulus is a great choice. If you would prefer a more polished version, Famulus is probably not for you. John Grunsfeld says Posted on October 24, 2006 97% 5.0 I was absolutely amazed at the speed of Famulus. In the handful of minutes I spent playing with it, I was able to launch the Firefox web browser, check my e-mail, launch my word processor and edit a text file. Famulus works more like a shell program than a launcher for specific programs. Hey folks! So I have a new computer and I am trying to make a launcher that will allow me to simply type into the prompt "file.exe" and it will open the specified file, if I type in an invalid address or command it will error. I know there is no code for this yet, but here are some things I have considered. I could make it an uninstaller that would remove itself after it has successfully opened a file. This would likely be the easiest to make, but has the downside of not being able to undo the command if a file was opened in error. I could have it simply create a file with the commands in it and make that file read only. This has a few drawbacks. First, when that file is opened there is no way to open it in another way like if I was to type the command into the prompt. Second, if I wanted to add a program or a file to the command list I would have to make it writable again and make a new entry with the information. If I did this multiple times I would have to make a way to hold multiple entries in the launcher and close the file when the number of entries reached a set number. Any help or advice would be greatly appreciated. I'll have to add a few things into the future, like search for a file by extension, display a list of folders that contain files, etc., but the initial one is easy enough.
