Symantec Ghost Solution Suite was developed to meet the need to create easily reproducible and portable image files that retain a snapshot of the installed operating system, applications, and data and retain those images on a logical volume, hot-plugged into a target system. Ghost Solution Suite is a collection of tools for creating and managing images of Windows FAT-based, NTFS-based, EXT2 and EXT3-based file systems. Image files created with Ghost Solution Suite are perfectly compatible with Windows XP, Vista, and Windows Server 2003 or later and NTFS volumes. Each image file has a unique name, is self-contained (fully-bootable), and contains useful information such as the location of the restore point, the date the file was created, and date of latest access to the image file. Ghost Solution Suite consists of the following tools: * LISVim: manages a logical volume of a file system image and retains both the image and the volume on a designated target system. * ImageDisk: creates a new disk image and supports the built-in Apple Disk Image Format (DFAT). * ImageBackup: creates a self-contained, bootable Windows FAT-based image file with an embedded drive and stores the image file in a specified location or on a designated network server. * ImageFix: restores the attributes of a Windows FAT-based image file to a specified location. * ImageInspect: displays the attributes and metadata of a Windows FAT-based image file, while retaining a copy of the image on a designated target system. * ImageRec: restores data from a Windows FAT-based image file. This tool cannot be used to restore complete FAT-based image files. * ImageShelve: stores the image file in a designated location or on a designated network server. * ImageExtract: extracts a file or folder from a Windows FAT-based image file. * ImageKeeper: can be used to track an image file or image image and schedule backup or restore at user defined intervals. * ImageConvert: converts a file-based image into an ISO image that can be burned onto a CD or written to a DVD for distribution or storage. * Image-E/-E: creates an image file from an empty hard disk (that is, a clean Windows install) and displays the usage information of the disk image. * ImageRemove: removes the image, volume, and/or restore point from a designated target system
