### What's New In PuTTY Session Manager?

PuTTY Session Manager (PuTSM) is a tool for organizing PuTTY sessions into subfolders that make the process of managing PuTTY sessions much easier. The application can be accessed through the system tray icon. PuTSM can be launched by right-clicking on the tray icon, or can be launched by the application's preferences panel. Features:

**Create session** PuTSM makes it very easy to create a new PuTTY session. You can set a session name and save it as a file, or save the session to a URL or download the session's page from an FTP server. PuTSM will ask for the location where you wish to save the session.

**Load session** When you open

---

PuTSM, it will list all the active PuTTY sessions on the machine and ask you if you wish to load them. If the session has already been downloaded, it will open in the session editor. If it has not, it will open the session's web page and load it automatically. Create session folder If you wish to have the session files saved in a separate directory, you can select the session's folder from the tree view. Edit session The session editor makes it very easy to edit an existing PuTTY session. You can edit the session's name, hostnames, port, username, remote IP address, and remote folder name. You can even remove a session. Export session PuTSM makes it very easy to save a session to a file or to a URL. You can save the session to a file and specify the path where you wish to save the file, or you can save it to a URL and specify the server or

---

directory where you wish to save the file.

**Settings** You can change the session manager's properties from its preferences panel. You can enable the use of transparency, allow the main window to minimize when you close the session editor, specify the program to run when the session manager starts, as well as enable and disable hotkeys.

**FileZilla settings** PuTSM makes it easy to access FileZilla's properties. You can enable FTP protocol, activate WinSCP support, specify the WinSCP port, set up proxies, and specify the FileZilla location.

**SmartRename 2.0** is an easy-to-use batch renamer that allows you to rename your files and folders using regular expressions and specify the number of lines that will be ignored during the renaming. SmartRename 2.0 allows you to: - select the columns of

---

your source text files and the destination folders where you want the files and folders renamed; - create a regular expression for renaming your files and folders; - specify the number of lines that will be ignored during the renaming; - add a description of each file or folder that will be renamed; - create a custom shell script
