Tip: Photoshop is a fully licensed software, so you can buy a copy or download a copy of the program from the Adobe website at www.adobe.com. How Photoshop Works Here's how Photoshop works: 1. Begin with a work area or canvas. The canvas — or work area — is where you place the image you want to edit. You can draw or import an image from a disk, the Internet, or other source. Always make sure that what you're doing will be possible with the image you're working with. If a person looks out the window at a lake, you might try to make it rain. However, it's difficult to make a believable rain scene as the person looks out the window at the lake. You might just end up looking silly. Photoshop is a program made for digital imagery. When you import or place an image on the canvas, it brings with it a series of layers that tell Photoshop how to create a realistic representation of the image. For example, if you place a photo of people standing in front of a hill in your canvas, then Photoshop is smart enough to know that all the elements on the canvas belong to one layer. In a layer-based editing system, you manipulate elements of an image without editing each individual layer. A single layer enables you to remove, duplicate, or change the color of one or more objects on the image. If you're using a RAW (raw) file, the program will automatically create layers for you as you import an image and bring them into the program. If you're working with a TIFF file, the program will import the entire image at once, creating only one layer. 2. Create one or more layers. You use layers to separate the image that you're working on into parts. Layers give you control over the image at a finer level. You can move, copy, or edit just one part of an image, rather than all of it at once. Editing an image involves creating or modifying multiple layers, which you have complete control over. In the Layers panel, layers are represented by squares and rectangles with an orange border. You can tell that the image is made of layers because each square and rectangle represents a layer and the squares and rectangles are not all the same size. The outer square is the Background layer, and the layer on top of it is the active layer. You can also use the Layer

Q: Passing data from the View to the controller I am trying to pass the data of 2 select boxes into the Controller. Here is the data that gets passed from view to controller: HTML: 1 2 3 4 -1 0 1 2 Controller (in case someone wants to see the code): public ActionResult AddCustomer(int select1, int select2) { // } Controller before work: public ActionResult Index() { int select1 = 0; int select2 = 0; var customer = new Customer(); select1 = int.Parse(ViewBag.select1); select2 = int.Parse(ViewBag.select2); customer.ID = select1; customer.Price = select2; customer.CategoryID = 1; return View(customer); } Customer class: public int ID { get; set; } public int Price { get; set; } public int CategoryID { get; set; } The problem: when I debug the code, the select1 = 3 and the select2 = 2 which is not what I am expecting it to be. I have no idea why this is happening. A: When you are posting your data through AJAX in the view you need to set the values of select boxes as empty string in the view. Select a value 1

Q: Extend the jQuery.each() function to accept string array Is there a way to dynamically add a second parameter to a jQuery.each() function so I can pass a javascript array of strings as the selector instead of having to manually create each element? Something like this (alas, it doesn't work. But if you can see what I'm trying to accomplish, you should be able to help) var styles = ["box", "blah", "qux"]; \$(".class").each(function(index, value) { // do stuff }); A: Use the spread syntax: \$.each(styles, \$(".class")); A case of neonatal granulomatous rosacea. Granulomatous rosacea (GR) is a rare disorder characterised by sudden appearance of tender nodular skin lesions in early infancy. Most reported patients are of Asian ethnicity, and cutaneous granulomatous inflammation is often associated with genital and anal lesions. We describe a case of a newborn girl with GR. Her skin lesions appeared 3 days after birth, later accompanied by genital lesions. The girl was a full-term female, weighing 2910 g, with no family history of systemic disease. Lesions began as areas of erythema, some appeared as flat plaques, and others showed blisters. A biopsy of a representative lesion showed hyperkeratosis with vacuolisation of the basal layer, dermal infiltrate of neutrophils and macrophages, as well as foamy macrophages. The diagnosis was confirmed by histological examination and cultures of the exudate were negative. She was treated with topical corticosteroids and no side effects were observed. Subsequent examination at 2 months and 2 years showed no active lesions. Cutaneous GR is an unusual condition in newborns that needs to be differentiated from other neonatal skin diseases. Its diagnosis is based on clinical and histological findings. GR usually appears as rapidly appearing nodules which in a minority may evolve into a blaschkitis-like disease. Severe cases may progress to scarring. The disease usually resolves spontaneously.
