Q: How to remove swizzle on NSTableView row when more than one scroll? I'm trying to make the NSTableView row clickable without the swizzle problem. So far, I have this, which makes the cells clickable, but there is still a swizzle problem: - (BOOL)tableView:(NSTableView *)tableView acceptsDrop:(id)info row:(NSInteger)row dropOperation:(NSTableViewDropOperation)operation { if (operation == NSTableViewDropAbove || operation == NSTableViewDropBelow) { return YES; } return NO; } -(NSDragOperation)tableView:(NSTableView *)tableView validateDrop:(id)info proposedRow:(NSInteger)row proposedDropOperation:(NSTableViewDropOperation)operation { NSLog(@"Rote %lu", (unsigned long)row); //NSDragOperation dro_operation = [info draggingSourceOperationMask]; //NSLog(@"dro_operation: %lu", (unsigned long)dro_operation); return (NSDragOperation)info.draggingOperation; } -(NSArray *)tableView:(NSTableView *)tableView validateDrop:(id)info proposedRows:(NSArray *)rows proposedDropOperation:(NSTableViewDropOperation)operation { NSLog(@"Rote %lu", (unsigned long)rows.count); if (operation == NSTableViewDropAbove || operation == NSTableViewDropBelow) { NSLog(@"Rote %lu", (unsigned long)rows.count); return rows; } return [NSArray array]; } -(NSDragOperation)tableView:(NSTableView *)tableView validateDrop:(id)info row:(NSInteger)row dropOperation:(NSTableViewDropOperation)operation { NSLog(@"Rote %lu",

Alternatives to recurrent laryngeal nerve monitoring in thyroid surgery. Recurrent laryngeal nerve (RLN) palsy is the most common complication of thyroid surgery. Preoperative identification of RLN anatomy is most useful in reducing the incidence of RLN injury. Preoperative ultrasound and intraoperative RLN stimulation with a cricothyroid shunt are effective methods for minimizing RLN injury. However, these techniques are not free of potential complications. A careful diagnosis of thyroid disorders and a favorable thyroid anatomy can help reduce the incidence of RLN injury.Q: Universal references and perfect forwarding with CRTP In Scott Meyers' Effective C++, pp. 106-107, he explains how to deal with potential ABI incompatibility in a base class, e.g. template struct A { virtual T convert() const = 0; }; struct B : A { virtual int convert() const { return 1; } }; struct C : A { virtual long convert() const { return 2; } }; Intuitively, B and C should be forward-compatible with each other: B* b = new B; C* c = new C; assert(b->convert() == 1 && c->convert() == 2); (Note that since B is not derived from C, B need not know that C exists.) However, the reference variables passed to the template constructors fail to compile because of ambiguity: struct D : A { virtual void convert() const { (void)this; } }; The rule can be overriden by using CRTP and working around the issues with perfect forwarding: template struct A { virtual T convert() const { return

static_cast(static_cast(this)); } }; struct B : A { virtual int convert() const { return 1; }
