In such an example, a comparator may be used to compare a power voltage received by an integrated circuit and a reference voltage received from a voltage generator. The comparator can provide an output (i.e., a level) if the power voltage is less than the reference voltage. The comparator can provide a zero output (i.e., no level) if the power voltage is greater than the reference voltage. Some comparators are designed to receive differential signals (i.e., a signal that includes a non-zero current and a signal that does not include a non-zero current). However, some comparators can not receive differential signals and thus need to receive a non-differential signal., "Tiësto", was released on March 29, 2010.
