The most versatile of Photoshop's tools allows users to modify the information in an image with a series of operations known as editing. Much of the time, users begin by choosing a format for new graphics, then placing them on layers so that they can be combined as they're needed. Layers are essentially groups of editing tools that have variable functions that can be turned on and off, depending on what you want to accomplish. This may seem like a very basic technique, but this type of functionality is very different than what most people are used to, and this why most of us find Photoshop to be so complex and difficult to use. In this tutorial, we'll create a new Photoshop document, work in layers, create a custom color palette, and use Photoshop's built-in shortcut function to help us save time and focus on the important elements. The results of this tutorial will appear on a single, brand-new layer with a new, custom color palette. Steps To Create a New File It's helpful to create a new, blank file before we begin. This allows you to start with a clean slate and start fresh, and if you want to experiment in a new document, you can always copy your work to a new file later. Tip If you already have a new file, there are a couple of ways to do a clean start. You can simply create a new blank document as you normally would and place your work into the new document. If you're using a Mac, you can press the Command + N shortcut. This creates a new blank document. Create a new, blank file On Windows, create a new document with the Ctrl + N shortcut. On a Mac, create a new document with the Command + N shortcut. After you do that, it's time to create some new layers. Create new layers You'll need to create a new layer to work on, since you're creating a custom color palette. You can do this by pressing Ctrl + Shift + N on Windows or Command + Shift + N on a Mac. Step 1 Click OK when you've created a new document and create a new layer by pressing Ctrl + Shift + N on Windows or Command + Shift + N on a Mac. Step 2 Photoshop Elements enables you to create the custom color palette right here. To do this, click the Layers panel menu (layers icon) and

Pulmonary surfactant is a major component of the lung surfactant system that spontaneously activates the innate immune system to induce clearance of inhaled, virally infected cells and apoptotic cells. Although surfactant appears to act similarly in the murine and human lung, it is possible that the surfactant and type II alveolar epithelial cells differ with respect to their immune-regulatory properties in adult humans and are implicated in acute and chronic inflammatory disease. The long-term goal of this proposal is to understand the role of pulmonary surfactant in the inflammatory response to lipopolysaccharide (LPS), an endotoxin that is a potent activator of innate immunity. Our central hypothesis is that alterations in surfactant composition and surfactant interactions with alveolar cells and LPS alter the innate immune response to LPS. Since clinical studies on intubated, mechanically ventilated patients have proven that surfactant replacement therapy reduces mortality and improves respiratory function in these patients, our specific hypothesis is that surfactant has potent immunomodulatory properties. The specific aims of this proposal are to (i) delineate the regulatory effects of surfactant on LPS-induced innate immune responses in adult mice;(ii) determine whether surfactant confers LPS resistance in vivo in adult mice;and (iii) examine whether alterations in surfactant composition or surfactant function in adult mice alter LPS-induced innate immune responses. Our approach to achieve the proposed aims will utilize: (1) the generation and characterization of novel mouse strains deficient in key innate immune regulatory proteins and surfactant synthesis and/or function;(2) the examination of how surfactant functions in adult mice exposed to LPS;and (3) the isolation and characterization of adult mouse type II alveolar epithelial cells. The proposed research will be carried out at the University of Washington School of Medicine. The results generated from these studies may provide the basis for future studies in human subjects on the role of pulmonary surfactant in modulating the pulmonary inflammatory response to gram negative bacterial infections. This proposal will also establish the foundation for future work that will delineate the immunoregulatory role of surfactant in the adult immune response to other immunological challenges, including alloantigens and environmental insults, as well as control the deleterious inflammatory response associated with acute and chronic inflammatory lung diseases. PUBLIC HEALTH RELEVANCE: Surfactant is a critical component of the lung

The present invention relates to a servo pump, more particularly, to a servo pump for motor driven vehicles. A typical servo pump of this type is disclosed in U.S. Pat. No. 5,184,522. The servo pump includes a housing that defines a suction chamber, a discharge chamber, and a control chamber within which there is a variable volume valve having an input port, an output port, and a control passage, and a servo motor that has an output shaft coupled to the variable volume valve through an output shaft bearing. The output shaft is rotatably supported in the housing by a pair of rolling-element bearings, each having an outer race ring and an inner race ring. Each outer race ring has a polygonal inner circumferential surface and a concave section provided in the inner circumferential surface such that the concave section surrounds an end of the output shaft. The inner race ring also has a polygonal inner circumferential surface and a concave section in the inner circumferential surface that is adapted to be disposed within the concave section of the outer race ring such that the inner circumferential surface of the outer race ring partially contacts the circumferential surface of the inner race ring. Accordingly, when the output shaft is turned, the inner race ring is rotated so that the input port and the output port on the inner race ring are connected to each other through the control passage of the variable volume valve. A spring is provided to bias the inner race ring such that the inner race ring is pressed towards the output shaft. The spring is arranged so that it is compressed between the inner circumferential surfaces of the outer and inner race rings. As shown in FIGS. 9 and 10, however, the serv
