The present invention relates to a method of reproducing stored data by using an optical disk and an optical disk apparatus. More specifically, the invention relates to the improvement of a method of reproducing data from the optical disk with low error rates. In recent years, the density of information such as image, audio, and computer data stored in information recording media has dramatically increased. At the same time, a demand for the high densification of the storage capacity of the disk medium or media in the information recording media has grown. One of the most important factors in improving the storage capacity of the media is to reduce the size of each stored bit. One of the methods for achieving the high densification is to reduce the wavelength of the laser beam used to read and write data. Generally, the size of each stored bit is 2xcex/NA (where xcex is the wavelength of the laser beam and NA is the numerical aperture of an objective lens). One method for reducing the wavelength xcex is to use an optical system with a large numerical aperture NA (for example, a numerical aperture NA greater than 0.6), as in the case of DVDs. The numerical aperture NA of the optical system is the aperture of the objective lens. Also, a method of reducing the wavelength xcex by making the track pitch on the medium smaller has recently been considered. This method offers the possibility of increasing the track density and simultaneously increasing the storage density, as compared with a conventional optical disk apparatus. However, the method involves a problem in that bit shift due to off-track motion of a read head and crosstalk from adjacent tracks take place, and the reproducibility of stored data becomes poor. This problem will be described below in more detail. Generally, the size of a stored bit is 2xcex/NA, where xcex is the wavelength of the laser beam and NA is the numerical aperture of the objective lens. In order to reproduce the stored data from the optical disk, the laser beam must be focused by the objective lens onto the disk surface. However, if the laser beam is slightly deviated from the optical axis of the objective lens, the laser beam is reflected and deflected by the surface of the disk and the laser beam is moved off of the track. If this off-track motion is in a radial direction from the center of the track, the off-track motion advances toward the outer peripheral side of the optical disk. If the off-track motion advances in the

Search form You are here The Literary Encyclopedia The Literary Encyclopedia is a scholarly source of articles on literature, other works of the arts, and biographies of authors and critics. Coverage has been significantly enlarged through the addition of new sections, such as film and literary history. The entire print edition is now available online with an accompanying A-to-Z index. The expansion of material also allows new searches to be done within the text of each article. The first editor-in-chief of The Literary Encyclopedia, Tanya Karmarkar, writes of her experience working on the newly-named Literary Encyclopedia: My job was to create and shape the database--from selecting the first authors to tracking the copyediting. I wanted to see a larger and more detailed picture of the present work. I wanted to clarify the divisions and placement of different topics. I wanted to allow the reader to find out more about the topics and authors they care about. I had two months to create the database. And the first wave of authors were like a fresh paint in a canvas. By the time all was said and done, we had more than a hundred authors and a few thousand words. Two weeks before the launch, I took a nap. I awoke to the reality of the first and only edition of The Literary Encyclopedia. It was full of errors and idiosyncratic cross-references, with no indications of the format or style of the text. I had no idea whether we should be adding and subtracting, which authors and topics belonged to which, or whether the in-between sections were supposed to be. All I could do was walk in circles around the section headings and try to keep my fingers crossed. But as the months went on, I could see that the LER was a remarkably stable, useful, and elegantly illustrated resource for scholars and serious readers alike. I am proud to have worked on it as its first editor-in-chief. One of the greatest features of the LER is its robust index, allowing quick location of topics within each text, and enabling

those who do not know the subject to still turn to a specific section. As another editor of the LER, Julia Harkavy, notes: "We had no plans to design a comprehensive reference guide, but many people said they found that the index is invaluable. Once the LER was launched, word spread quickly, and several people have used the index as the basis of their
