Don't be fooled by the "childlike" name. There's nothing about Adobe's way of thinking of creative light that's "childlike" at all, and in fact, most of its features are very similar to Lightroom's editing features. Adobe Photoshop Elements The Photoshop line of software has evolved to take on many of the features of both the Photoshop CS and Photoshop CS5 lines, but it also offers tools that are aimed at a beginner audience. If you're looking for a beginner's program, then a more appropriate one is Photoshop Elements. It's designed to step out of the shadow of the Photoshop models and let you do things in a more accessible and easier way to see what you're getting yourself into. The Photoshop Elements line of products includes all aspects of the creative light workflow, including the following: A main program, Photoshop Elements 11, with the following feature set: Elements fixes problems as they occur and is not based on the layers concept of a main program like Photoshop. Elements doesn't come with a layered file format that makes it more difficult to edit with a device (such as a scanner or a flatbed scanner), but it does offer some tools for importing layers of photographs from other programs into a single working document. Photoshop Mix, which enables you to mix layers, art brushes, and more; Photoshop Sketch, which offers easy-to-use tools for sketching and designing basic artwork; and Photoshop Capture, which enables you to capture and save images from the web or import other Photoshop files and apply them to a working document. You can create a slideshow with many transitions (see Chapter 5) and insert still images, video, or music (see Chapters 8 and). Photoshop Elements 11 has a number of these tools, including the infamous Liquify filter, in a very lightweight program. It does not offer the same degree of flexibility and power, but it's still powerful enough to make anything you can dream up a reality. Photoshop Lightroom Lightroom, developed by Adobe Systems and provided as a cross-platform editor for RAW (unprocessed) images, offers a number of features that can be used to achieve a more finished look to images and videos. It has multiple tools for enhancing the look of a photo: Adjustments, a wizard-based tool that enables you to create black-and-white and color adjustments. You can fine-tune an image and

Electrodeposited palladium, platinum, and gold coatings are currently employed in a wide variety of applications, for example, in the formation of catalytic electrodes for fuel cell and other electrochemical cells. Such coatings, e.g., the Pd-O and Pt-O bonds, have excellent durability and are relatively stable in acidic and alkaline solutions. In some cases, such as, for example, the preparation of noble-metal electrodes, particularly electrodes for the proton-exchange membrane fuel cell, the thickness of such electrode deposits must be precisely controlled. A commonly employed method for achieving thickness control is electroplating, e.g., anodically depositing the metal on a rotating cathodic metal strip. This is a method of choice when precise control of the deposit thickness is needed, as it permits one to precisely control the current density and the time of the electrodeposition. For example, U.S. Pat. No. 4,262,013, to Loughran, Jr. et al., describes a method for electroplating an electrode in which the current density is controlled by rotating the electrode during the electrodeposition, while U.S. Pat. No. 4,433,010, to Pou, describes a method wherein the thickness is controlled by rotating a current source. The control of electrodeposition of such coatings by controlling the voltage and current is a difficult and imprecise process. This is best understood by considering the behavior of the current density as a function of time during the electrodeposition of the metal. This problem has been previously addressed in different contexts, see, e.g., "Production of Thick, Uniform Electroplated Metal Films" (1953) by Heyndels and in "Electrodeposition: Fundamentals and Industrial Applications" (1966) by Van den Berg and Matthews. In any event, it is known that the rate at which deposition takes place on a metal strip is proportional to the average current per unit area (the average current density) and is inversely proportional to the square root of the absolute value of the difference between the deposition potential and the average potential across the metal strip. This relationship means that the average current density will be higher when the difference between the average potential and the deposition potential is lower; however, this is usually achieved at the expense of the deposition time, because the average potential is usually set at a higher level. Thus, the average current density is not sufficiently high

When it comes to our materialist culture and what we own – or don't own – our behaviors, attitudes, and values have a lot to do with it. When we think about our material goods, we often hold on to them because they bring with them a feeling of comfort, safety, and security. We value them for the ways they can protect us. They can keep us warm, give us ease, give us the sense of the things being "mine". Perhaps the biggest lie we've been told by the economic status quo is that our worth is determined by our possessions. You may not even have the things you want or the things you need, but you're worth something just the same. In some way, every thing we own is a clue as to how good a person we are, for better or for worse. I know a number of people who've never owned a house, a car, or clothes. And they are worth it. Because these are things a materialist culture tells us we need to be a good person – or at least to have the veneer of a good person – we have to hold onto them, often for dear life. We own things because we feel ashamed to be seen without them. We own things because we hope to convince other people we're "up to" them. We own things because we don't know how to give them away. I've written before that we live in a society of duality. Everything is good or it's bad. Everything that is, is good. Everything that is not, is bad. We live in a time of good and bad, up and down, right and wrong. And all that is so damning. But the truth is, the binary is terrible. Both "good" and "bad" are simplistic and wrong. "Good" is simply how we feel. "Bad" is simply how we judge. "Good" means I give you pain. "Bad" means I give you pleasure. After all, as long as I don't get in the way, the pains of good can be good, and the pleasures of bad can be good. This is why there is no such thing as being "good"
