An o-phenylphenol (OPP)-based flow-injection system has been developed for the routine determination of OPP in water. The method is based on the oxidation of OPP in an alkaline medium to a radical cation, resulting in the formation of a pink color. This reaction is studied and optimized under the influence of two factors, such as alkalinity, reagent concentration, buffer pH, and sample, in terms of their effect on the signal intensity. Under optimized conditions, a relative standard deviation of 1.6% and 2.5% for 0.3 and 1.0 mg L(-1) OPP in a 5 mL sample, respectively, was achieved. Beer's law is obeyed in the concentration range 0.07-0.30 mg L(-1) and 0.07-0.75 mg L(-1) for 0.3 and 1.0 mg L(-1) OPP, respectively, while the limit of detection was found to be 0.03 mg L(-1). The system was applied for the determination of OPP in raw water samples. OPP was found to be present in the water samples in the range of 0.06-0.21 mg L(-1).Microsoft Office 2013 is now available to all developers. And of course, Microsoft has just released Office 15 RTM. Microsoft Office 2013 RTM Microsoft Office 2013 RTM is the latest version of Office for developers, including Web, Windows 8 and Windows RT. This version is already available to download for all paid users. The RTM stands for Release to Manufacturing, which means that the final version of the software is available. Office 15 RTM will not be available for a long time since today is the first day it is available. However, its retail availability is expected during the first week of June. What's new in Office

versionSecondary structure of polynucleotides
from chicken keratinocytes. Poly (C,G) was found
to have a mole ratio of 1.23:1. As defined by the
differential scanning calorimetry, poly (C,G) had
two transitions. The first phase transition was a
loss of helical structure accompanied by an
increase in random coil conformation, which
occurred over a temperature range of 37-43
degrees C. The second phase transition was a
very sharp endotherm characteristic of the onset
of self-association. The helical structure of poly
(C,G) was stabilized by the binding of 1.5 M Na⁺
on both the poly (C) and poly (G) sequences of
poly (C,G). Sodium did not affect the first
transition of the poly (C,G) and isothermal
denaturation, but it did stabilize the helical

structure of the oligonucleotide, thereby shifting the first transition to a higher temperature. The correlation of these results with the biological function of polynucleotides suggests that poly (C,G) is a major structural component of the cell nucleus.

Q: How to use a variable inside a bash script

In the following example, how does it work that I can use \$VAR inside a script?

```
#!/bin/bash
VAR=foo echo "var is $VAR"
```

A: Variables declared in a script or function can be accessed within the script using the \$() construct:

```
#!/bin/bash
VAR=foo echo "var is $VAR" $((VAR += 1))
```

A: In bash, variables are declared using the var=value syntax. They are implicitly global, and so can be accessed anywhere in the script without an explicit scope.

A: If you need to assign your variable in a script you can use command -v nameVariable && export nameVariable command -v command will return 1 if your variable is defined. export command will export your variable in current shell.
