_Figure 1-17: To the left is an image of some reindeer. To the right is the same image, with the background has been changed to a blue color and the reindeer have been turned into a silver color.

Notice the amount of white space that has been added or subtracted from the image as well as the altered shapes of the reindeer._ The following pages illustrate some of the many things you can do with Photoshop, as well as the various techniques and filters used. # **Create a New Photoshop Document** In order to edit an image, you must first create a new Photoshop document. It's important to

think of Photoshop as a complete application—you won't be able to edit your work in an existing Photoshop document, as you would in other image editing applications like Microsoft Paint. You begin by creating a new Photoshop document (a new document refers to the area in which you want to do your editing) by choosing File → New, or pressing Ctrl+N. The application offers many default file names, but you can customize the name as needed: The document's default size is 612 pixels across by 824 pixels high, which is good for the Macintosh (because it's 640 pixels by 640 pixels). The application offers standard ways to crop and resize the document. Photoshop also includes the

ability to completely zoom in to a document on-the-fly, which makes it easy to pick out areas that need work.

****Note:**** You can create a new document by using the File menu's Save As command to create a new document; simply choose a filename and then click Save. After choosing New, Photoshop creates a new document for you. You can then work on it and save it at any time (see the next section for details on saving an edited image). ****Note:**** In older versions of Photoshop, the New document opens at the image size (where you are in the image editor when you click New). In later versions of the software, you can choose from a number of default documents. Click the triangle

next to the File menu to see all the available document types. # **Using the Photoshop Menu** The Photoshop menu contains a number of tools that you can use to manipulate your image. ## **Basic** The first menu option—Basic—has several functions. This menu contains basic tools for flattening the image and for resizing and rotating

When you create an image in Photoshop Elements you can use different tools to edit your photo. Many people use either Elements or Photoshop for tasks such as adjusting colour, brightness or exposure.

Photoshop Elements is a basic, entry-level program for editing photos, graphics, web graphics and other images. It's available for Windows and Mac OS X. As an alternative to Photoshop, it's equally useful for hobbyists and professionals, at any level. Elements is the basic version of the software, whereas Photoshop is a professional-level software that is more powerful and has more complex features. Photoshop Elements 9 is a good version for basic photo editing. When you use Photoshop Elements you're probably less likely to want to use some of the advanced features that the professional version offers. How to use Photoshop Elements To get started using Photoshop Elements, launch the program and click

the Start Menu button or use the keyboard shortcut Ctrl+E. To help you get more out of it, the program will open with a tutorial. Press the button to show all your open documents in your web browser. Click the File menu option. Select the Open option. Select Photoshop Elements. This opens the Photoshop Elements dialog box. You can view your open documents with the most recent document at the top of the dialog box. If you decide you want to work on another document later, you can also use the Open dialog box to select another file. This looks very similar to the Photoshop dialog box. You'll use a similar method to open files in Elements. Select a file and click Open. Once you've opened your first

document, you can use the toolbar at the top to navigate through your document. Use the buttons in the toolbar to open a toolbox of editing and editing options. Use these options to crop, resize and create effects in your images. Resizing your image with the free-hand option makes it smaller in both width and height. If you want to make more precise changes, you can use the crop tool. This tool allows you to remove part of the image and save it as a new image or as a selection. You can also use the effects tool to make your image more interesting. This tool lets you create a variety of effects and effects layers. You can add a

Q: How to make a contact searchable? I am building a contact app for Android where people can search for contacts and see the details and also be able to send them a message. The search results list are filtered by entering text in the search edit box. I want to add the option for the user to select a contact to search for and if found see the contact details. What I want to know is, where to store the data in the filesystem, how to display the data in the UI, how to find the contact data, how to let the user select the contact if found, the phone will only be sending an alert if the number is not in the database or what

to do if the phone number is found in the database but is not in the search results. I can't get my head around the design/UI of this idea. The idea is to not store contacts in the SQLite database but store a type of address book data in the filesystem and query it to get the contact details and also enable the user to search for a contact number in the phone number table. Any pointers as to how I should approach this are welcome! A: Not exactly an answer but if anyone wants to know, I tried to implement this and this is how I did it: The UI Textbox to search for a contact ListView of the contacts that were found in the search with search results on top and different information The Contact List A part of the address book containing

contact details and a phone number list. Search A TextFilter uses an underlying Tree of Contacts to build a query from a search box input string. The Contact List A TreeFragment adds a SearchFilter to the Tree of Contacts. I added a Map of Contacts to use as a data storage, a TreeFragmentFragment which contains a TreeFragment and a SearchFilterFragment. Each Contact in the Tree is a row in a table. I used a DialogFragment which the search results are in a Fragment and a DialogFragment with a Dialog. Duplicate one or more images. Then, with the Clone Stamp tool, use the mode described above to create a duplicate of an image. Add a new layer, and use the Paint Bucket tool (Windows: Rectangular Color Selection tool) to fill the layer with a color of your choice. Then, with the Burn tool (Windows: Magnetic Lasso), erase the background around the area of the image you want to keep. Use the Gradient Map to create a cool lighting effect. In the Channels panel, add a new

layer and fill it with colors. To duplicate the colors of an image onto the new layer, go to Image → Adjustments → Levels. If you duplicate a layer, change the blend mode to Multiply. .
