I have a random function $f: \Omega \rightarrow \mathbb{R}$ where Ω is a finite set. Consider a random function $h: \Omega \rightarrow \Omega$, so that $h \in \Omega \rightarrow \Omega$, $h: \omega \mapsto h(\omega)$. Let r_1, r_2 be two random variables, with $r_1, r_2 : \Omega \rightarrow \Omega$. Is it possible to define a function $f: \Omega \rightarrow \mathbb{R}$, such that $f(\omega) = r_1(\omega) \sqcup r_2(\omega)$? I want to know if it is possible to have such a f in some sense, but I'm not sure if the problem is trivial or not. Since Ω is a finite set, r_1 and r_2 are not necessarily independant, and the definition of the random function f is clearly weak. It is maybe possible to make a use of the fact that h is discrete and deterministic to define f as a combination of r_1 and r_2 , or would it be a simple case
