To access Photoshop and make a selection or start the process of an image file, choose Image | Start or click the Photoshop icon on the Windows taskbar, click the Photoshop icon in the Dock, or press +W. Trying out the Quick Start palette After opening Photoshop (see the preceding section), the Quick Start palette (see Figure 2-4) appears. This palette provides tools for making selections and types of changes to images. **Figure 2-4:** Learn the Quick Start palette at a glance. Selecting everything Selecting everything in an image isn't a good idea, because it makes an empty file. Instead, use the Rectangular Selection tool to make a selection of the entire image. Use the Quick Selection tool to select the entire image by clicking and holding down the Shift key. Click the mouse to select the other portion of the image that you want to select. After the image is selected, the Select and Mask dialog box opens with the paths select for the selection highlighted (refer to Figure 2-5). You can select and deselect the area you want to use with the mouse by clicking the box with the grips and moving the mouse. When you're finished, click OK to close the dialog box and return to the Quick Selection tool. **Figure 2-5:** Create your selection with the Quick Selection tool. Adjusting the brightness and contrast Adjusting the brightness and contrast of an image makes it look better in a variety of ways. Both parameters can be adjusted manually, and both have a range of settings available to you. To adjust the brightness, right-click the Brightness setting and choose Manual, and then drag the Brightness slider to the left. To adjust contrast, click the Small toggle (shown in the margin) and drag the slider to the right. The Amount sliders (in the top left of the dialog box) allow you to adjust the image's brightness and contrast by the percentage settings available. After you set the settings, click OK to close the dialog box. Moving stuff around You can use the Move tool in Photoshop to drag items around within an image. You move the items with the mouse, and the image moves with the mouse. Items that are already selected remain selected while you drag, but you can deselect them by clicking them and then dragging them to a new location. Figure 2-6 shows a sample image of a girl

Having a good portrait can make an excellent work of art. In this tutorial, you will learn how to make a portrait in Photoshop. Make sure to follow the steps carefully. Watch the video carefully and repeat the tutorial as many times as you want until you are completely comfortable with the process. Begin with a digital photograph and basic portrait skills. The camera may record a slightly different image than what you are expecting. Import the image into Photoshop as the background. For the background color, create a new layer and use it as the background color. Mask the background from the foreground. Masking will prevent any unwanted background from appearing in the final portrait. Select the selection brush and then choose the background color. Select and drag the foreground color to the trash can. This will remove the background and give the foreground more definition. An image in the foreground can be as large as you want. To make the image smaller, you can use the resize tool. Make the image smaller by dragging the edges of the image smaller and smaller until the image is small enough. Once the image is the size you want, drag it off the edges of the canvas and place it in the center. To edit the image, use the paintbrushes with different colors and shapes. Use the rectangle to create a new layer and then make the layer a selection for a mask. Now, you can use the mask as an eraser tool. Select a brush and then erase the unwanted background. Another way to do this is to use the eraser tool and then choose the brush tool. Change the brush to a 05a79cecff

Q: Orbital velocities of large moons The Wikipedia page on Earth satellites says that the orbital velocity of large satellites is (roughly) $$v \approx \sqrt{\frac{G m_s}{r}} = \sqrt{\frac{m_s}{r}} \sqrt{\frac{M_E}{M_S}} \, v_E \,.$$ where m_s is the mass of the moon, r is the distance between the center of mass of the Earth and the moon, M_E and M_S are the mass of the Earth and the moon, and v_E is the orbital velocity of the Earth. Then the end of the Wikipedia page says that References 1. Banach, A.; Karwowski, K. The gravitational fields of planets and of their satellites. Bull. Amer. Math. Soc. 39 (1933), no. 7, 482–500, ...but I can't seem to find this reference. Can someone give me a proof of this? I suspect that there is a non-relativistic limit on what's being done, but I can't really see it. A: You can use the Newton second law: $$F = \frac{dv}{dt} = \frac{m_s}{r^2} \sqrt{GM_E} \frac{dv_E}{dt}$$ and an integration to get $$v = \sqrt{\frac{GM_E}{r}} \sin \theta + \frac{a_s}{r} \cos \theta$$ where θ is the angle between the Moon and the Earth and a_s is the semi-major axis of the Moon's orbit and a_s Airborne microplastics at coastal sites around the world: emerging research and how we can combat their presence.
