To explore the kinetic mechanism of the methylation of thiopurine metabolite in Chinese people by using TPMT genotyping as a biomarker to evaluate the activity of the conjugation. Samples of erythrocytes were collected from 28 healthy blood donors with matching activity assay of TPMT. Routine analyses of the thiopurine metabolites 6-MP, 6-TGN and 6-MMP were performed. Enzymatic kinetics assays were conducted in 96-well microplates for each donor, and the reaction rates were fitted to a simple mathematical model: [formula: see text]. The results of the kinetic analysis showed that the Michaelis constant (Km) of TPMT for 6-TGN was much higher than that of 6-MP. The activities of 1cdb36666d

Make sure it is properly downloaded from the official website.The invention relates generally to a technique for interfacing parallel or serial I/O address space with devices that access the I/O address space using another interface protocol. Microprocessor systems include address space that is generally accessible via one or more bus structures. The address space may, for example, be internal and accessible via an address and data bus, or external and accessible to an external device via a peripheral bus, such as a USB, PCI, or VESA bus, and the like. The CPU in the system typically accesses the address space via software in the form of program code, data, and/or stack information. As the amount of address space available in these systems increases, the overhead of managing the address space, including devising mechanisms for accessing the address space, becomes a significant problem. This overhead increases the complexity of the software, the time to complete a given transaction, and the size of the data structures or stacks needed to store information as well as the software and data processing required to perform I/O operations. One way to access large amounts of address space in a microprocessor system is to establish and interface with separate address and data busses. To this end, the address and data busses may be multiplexed onto a single bus structure. Using such a configuration, the address and data busses may function independently of one another. If the address and data busses have separate interfaces, each interface may be provided with separate hardware to permit transfer to and from the address and data busses, such as a memory controller. In some cases, including clock gating between the address and data busses may be achieved. In some devices, the address and data busses are provided on the same bus, but each bus has its own local (single-ported) control interface, while a common control
